

Notation from Lutkepohl 2005:

(Section 2.1.1., p.13)

The object of interest in the following is the VAR(p) model (VAR model of order p),

$$y_t = \nu + A_1 y_{t-1} + \cdots + A_p y_{t-p} + u_t, \quad t = 0, \pm 1, \pm 2, \dots,$$

where

- $y_t = (y_{1t}, \dots, y_{Kt})'$ is a $(K \times 1)$ random vector,
- the A_i are fixed $(K \times K)$ coefficient matrices,
- $\nu = (\nu_1, \dots, \nu_K)'$ is a fixed $(K \times 1)$ vector of intercept terms allowing for the possibility of a nonzero mean $E(y_t)$,
- $u_t = (u_{1t}, \dots, u_{Kt})'$ is a K -dimensional white noise or innovation process:
 - $E(u_t) = 0$,
 - $E(u_t u_t') = \Sigma_u$,
 - $E(u_t u_s') = 0$ for $s \neq t$,
 - The covariance matrix Σ_u is assumed to be nonsingular if not otherwise stated.

Multivariate Least Squares Estimation

(Section 3.2.1, p.70)

It is assumed that a time series y_1, \dots, y_T of the y variables is available, that is, we have a sample of size T for each of the K variables for the same sample period. In addition, p presample values for each variable, y_{-p+1}, \dots, y_0 , are assumed to be available. Partitioning a multiple time series into sample and presample values is convenient in order to simplify the notation.

$$\begin{aligned}
 Y &:= (y_1, \dots, y_T) && (K \times T) \\
 B &:= (v, A_1, \dots, A_p) && (K \times (Kp + 1)) \\
 Z_t &:= \begin{bmatrix} 1 \\ y_t \\ \vdots \\ y_{t-p+1} \end{bmatrix} && ((Kp + 1) \times 1) \\
 Z &:= (Z_0, \dots, Z_{T-1}) && ((Kp + 1) \times T) \\
 U &:= (u_1, \dots, u_T) && (K \times T) \\
 y &:= \text{vec}(Y) && (KT \times 1) \\
 \beta &:= \text{vec}(B) && ((K^2p + K) \times 1) \\
 b &:= \text{vec}(B') && ((K^2p + K) \times 1) \\
 u &:= \text{vec}(U) && (KT \times 1)
 \end{aligned}$$

The OLS estimate of B is given by (eqn.3.2.10, p.72):

$$\hat{B} = YZ'(ZZ')^{-1}.$$

An unbiased estimator for Σ_u is (eqn.3.2.19, p.75):

$$\hat{\Sigma}_u = \frac{1}{T - Kp - 1} \hat{U}\hat{U}'.$$

Estimated standard errors of the coefficient estimates are the square roots of the diagonal elements of (eqn.3.2.21, p.77):

$$(ZZ')^{-1} \otimes \hat{\Sigma}_u$$
